

Landsat - Estimating Biomass Loss from a Large Fire

The fires in Greece during the summer of 2007 devastated large tracks of forest and ground cover in this Mediterranean region. These before (left) and after (right) images were taken on July 18 and September 4 by Landsat-7. The red areas show the extent of the biomass loss from the fires.

Problem 1 - Using a metric ruler, and the conversion 1 kilometer = 0.62 miles, what is the scale of the image in meters per millimeter?

Problem 2 - About what is the total area, in square-kilometers, of this photo of Greece and its surroundings?

Problem 3 - About what was the land area, in square-kilometers, that was burned?

Problem 4 - What percentage of the total area was lost to the fires?

Problem 5 - Suppose that a typical forest in this region contains about 5.0 kilograms of biomass per square meter. How many metric tons of biomass were lost during the fires?

Answer Key

Problem 1 - Answer: The legend on the lower right indicates that 12 miles = 12 millimeters, so in kilometers this becomes $19.4 \text{ km} / 12\text{mm} = \mathbf{1.6 \text{ km/mm}}$

Problem 2 - Answer: The field on the right measures $78\text{mm} \times 98\text{mm} = 125 \text{ km} \times 157 \text{ km} = \mathbf{19,700 \text{ km}^2}$.

Problem 3 - Answer. To estimate the area of irregular regions, divide the image into a suitable number of smaller squares, for example, 5mm on a side (= 8 km on a side or an area of 64 km^2) as shown in the figure below. The full area has 13 squares across and 19 squares vertically, for a total of 247 cells and a total area of $16,000 \text{ km}^2$. Because the drawn cells are slightly irregular, we can re-calculate their average area as $19,700 \text{ km}^2 / 247 \text{ cells} = 80 \text{ km}^2$. The land area is covered by 173 cells for a total area of $173 \times 80 = 13,800 \text{ km}^2$. The red areas that were burned total about 30 cells or $2,400 \text{ km}^2$. Students answers will vary depending on how they counted the cells. Students may combine their counts and average them to get a more accurate estimate.

Problem 4 - Answer: $100\% \times 2400 / 13800 = \mathbf{17\%}$

Problem 5 - Answer: $5.0 \text{ kg/m}^2 \times (1,000,000 \text{ m}^2/\text{km}^2) \times 2,400 \text{ km}^2 = \mathbf{12 \text{ billion kg or 12 million metric tons}}$.
